

# Are Your Emails and Harddrive Data Safe?

Ever wondered what happens to those deleted pictures, files, or internet cookies on your hard drive?

Do you realise how easy it is, for family members or your co-workers to see what website you have been visiting?

Sensitive data can easily fall into the wrong hands. And because Windows is not capable of deleting information beyond recovery, you are at risk! Online banking passwords, financial documents, even those "about last night" e-mails are fair game for the IT professional, computer technician or hacker.

Most people are shocked to learn files have been placed on their computer (without their knowledge or permission) that create user profiles and document their Internet activity. Few realize every picture, video clip, graphic or chat room conversation is written to their hard drive.

Whether your data is sent to the Recycle Bin or your entire drive is formatted and repartitioned the chance of unauthorized discovery is very real and poses issues of risk and liability.

CyberScrub Privacy Suite Professional erases all evidence of your on-line history. Not only that, but it will also Delete, Wipe, Overwrite, Destroy emails, Erase previously "deleted" files/folders, and remove data beyond recovery.

CyberScrub's Privacy Suite is an award winning utility that will improve system performance, and make sure that your previously "deleted" data is not recoverable. It is also ideal for Return of Leased Assets and Computer Disposal.

So don't take the risk, destroy your sensitive data for good with CyberScrub!

CyberScrub Privacy Suite is distributed by Banksia Software. RRP: \$89
