

History of web design in Sydney

The internet which started off as being an effective medium for the transfer of information from a source to a destination now stands as the link to the whole world.

Life is considered impossible without the internet not only because of its resourcefulness but also of the millions of jobs it is providing directly as well as indirectly. Though we notice that the web technology was first developed by an English man and later the development focus shifted to the US, Australia has also made noticeable contribution in the field of web design, web development and computing technologies. Looking into the application of web, we see many Australians and Australian companies as pioneers in this field. There were a few Australians who made notable contributions in designing the very platform of web. Since then there was no looking back in the field of advancement. Now there are many award winning noted website design firms which are seen mushrooming in Sydney and Melbourne. David Green, an Australian researcher in bioinformatics, was the first Australian to launch a web server. His works are famous and noted and is a speaker in universities in Sydney and Brisbane. The second (some say third) website on the web was on astrophysics and the web server was installed in Sydney's Radio physics laboratory. The Basser Department of Computer Science Honours students installed a web server at the Sydney University in the early 90s. It was done by Ledwidge Michaela who supported a local website registered with NCSA. Thereafter in phases, the concept of web technology slowly developed in Australia. The uniqueness of the websites created in Australia lies in their sophistication while at the same time they maintained a user friendly interface. The websites created in Australia gradually gained popularity with its elusive designs and graphics. With the introduction of fourth generation and fifth generation HTML technology came a big improvement in website designing technology which also gave a dynamic nature to the web pages. Today, Australia stands in the forefront of website designing technology and promises more such enigmas in the near future. It is quite interesting that you can find many companies as well as entrepreneurs who are into the business of providing web designing services to their clients. You can also contact these firms as they tend to give you the best possible service.
