

NETaccounts gives small businesses the ability to manage inventory

NETaccounts, Australia's leading online accounting application for small businesses, consumers and accounting professionals today announced the release of version 4.0, giving small businesses the ability to set-up, manage and report on inventory items within their businesses.

Version 4.0 will introduce significant improvements to how a business inputs, adjusts and reports on inventory items, reducing the amount of time it takes to process and manage the inventory.

In addition to the inventory functionality offered in NETaccounts version 4.0, the new release offers:

- Improved purchase and sale screens combining the old simple transaction and invoice screens
- Creates quotes and orders and converts them into invoices
- Ability to build a combination of items from components in inventory
- Categorises imported transactions as sale and purchase payments

Throughout the development of this release, we have been diligently working in parallel with numerous Australian small business owners to ensure that their inventory requirements were being met by our online accounting application, said Marc Lehmann, Executive Chairman of NETaccounts.

Our product is in huge demand by a large number of small businesses across Australia due to its ease of use and \$30 a month price tag, he added.

A FREE 30-day trial is available at www.netaccounts.com.au
