

Transport Canberra and City Services maps tree canopy from aerial laser scan with FME and 1Spatial

Expert consulting services accelerate analysis of aerial LiDAR data; Accurate tree canopy maps enable more targeted management strategies

Sydney, Australia, 20 March 2017 (www.1spatial.com) 1Spatial, global leaders in managing geospatial data, today announced that Transport Canberra and City Services (TCCS) recently engaged 1Spatial to analyse and extract aerial laser scanning data to accelerate the process of establishing baseline data for Canberra's urban tree canopy coverage. A new case study featuring TCCS and Safe Software's FME application has been posted ahead of free FME World Tour events this week in Sydney and Melbourne – www.1spatial.com/fmewt The relationships between climate change challenges, sustainability goals and community expectations are key drivers in TCCS's development of an urban tree planting program. Informative and current data sets are being used to inform management strategies by overlaying age, density and condition data and proposing future canopy density targets. The establishment of current baseline data for Canberra's urban tree canopy coverage was essential to the program. In this respect, two data sets were available: a 2010 ground-based audit of trees in streets, verge areas, open spaces and parks; and new aerial laser scanning LiDAR (Light Detection And Ranging) data for the majority of urban areas across Canberra. With a tight timeframe of four weeks to complete the project, TCCS needed to quickly analyse and extract the LiDAR data relating to trees and combine it with the ground-based audit data. After evaluating different tools and methods, TCCS chose Safe Software's FME application and engaged 1Spatial, a Safe Software Value Added Reseller and Platinum Partner, for their expertise in analysing and extracting LiDAR data to accelerate the process. "We were keen to use FME because we have an existing skills base," said Daniel Goodwin, Acting Manager, Asset & Data Integration for TCCS. "FME is more user friendly than other approaches which require more specialised expertise. It also provides full transparency into the process which makes it very good for iterative development. With other tools, we weren't sure we could get the outcome we wanted in the available timeframe." A 1Spatial consultant was contracted for two weeks to identify tree-related data points in the LiDAR dataset and generalise them to create smooth representations of the tree canopy. "Within a week, 1Spatial had a good product output, and then we ran some refinements over the next week," said Goodwin. "We used out-of-the-box smoothing algorithms in FME to generate very compelling data for our analysis." As 1Spatial was able to deliver ahead of schedule, the Directorate could save time and use its own FME skills more productively. This included verifying the tree canopy data, integrating it with other datasets and creating mapping tools for strategic tree planting and management. When the final tree canopy data was displayed in TCCS's Geographical Information System (GIS), with canopy coverage calculated as a percentage, the value of the LiDAR data was immediately obvious. "The LiDAR data was crucial in determining the canopy cover," said Goodwin. "Publicly available Web mapping tools tend to merge urban and non-urban areas and overestimate urban tree cover. When we focussed on the urban areas we have control over, we could see which suburbs and streets have less canopy cover than others and better target our tree management strategy." TCCS can also use the new data to facilitate implementation of the urban tree planting program and communicate with key stakeholders. An interactive Web mapping tool is currently being developed to be used by urban tree planners, designers and contractors. "FME is a great tool for handling large volumes of aerial LiDAR data and integrating it with other geospatial datasets," said . "Although aerial laser scanning is now becoming common, relatively few people have the skills to manipulate LiDAR data, and we were delighted to be able to assist TCCS." www.1spatial.com/transport-canberra-city-services Notes to Editors About 1Spatial 1Spatial is the global leader in managing geospatial data. We make data smarter by making it more current, more complete and more consistent – ensuring decisions are always grounded in the best available information. Our unique, rules-based approach delivers enterprise-scale, cross-platform, automation to all stages of the data lifecycle. It builds confidence in the data while reducing the time and cost of stewardship. Our clients include utility and telecoms businesses, transport organisations, national mapping agencies and government departments. A leader in our field, we have over forty five years' experience and a record of continual innovation and development. www.1spatial.com
