

# A solution for Hobart's command centre

Intersystems has successfully deployed Hobart Airport's operational command centre media solution that collects operational data from over 16 input systems and allows Hobart operational staff to output that data in any configuration to two video wall loca

When Hobart International Airport approached Intersystems to tender for their operations centre video wall project, the solution that we came up with used very little of our own software or hardware, but was a great solution for them. With a solid track record delivering systems integration work, we knew we could deliver the solution that best suited Hobart Airport.

"The project required our team to work as a systems integrator, similar to how we would if we were delivering an airport operational database (AODB) solution," added Bruce Allen, Intersystems CEO.

Intersystems was selected as the system integrator, after a competitive tender process, to deliver a complete media solution to drive several operations control video walls in our newly completed HIAPL Accommodation Building.

The solution delivered provides Hobart Airport with the resources required to effectively manage the airport under any scenario, within an easy to use platform allowing airport operators to focus on the task of running the airport opposed to getting caught up in the technology.
