

ArtistScope Site Protection Software (ASPS) Now Supported On All Devices

The ArtistScope Site Protection Software (ASPS) has provided the most secure and most robust copy protection for websites since 2011. However, until now the ArtisBrowser, which is required to unlock and view ASPS web content, has been available for Windows computers only.

But now ASPS is supported across all popular OS and devices to include Windows computers, Mac computers, Android phones, Apple iPhones and iPads. The Mac version of ArtisBrowser was released in September 2020, the Android version released March this year, and the iOS version for iPhones and iPads was released on the 26th of April.

There is no comparable solution to ASPS. What makes ASPS so secure is that it creates a secure tunnel between the web server and the user's web browser (ArtisBrowser) in which nothing can be copied or intercepted, and while an ASPS web page is on display, nothing can be copied in any way. Normal web browsers, which have always been useless for copy protection, cannot get ASPS pages, and even if they could, they could not decrypt the web page to extract anything at all. In fact ASPS web pages are even secure from packet-sniffers.

The ArtistScope Site Protection Software (ASPS) provides the most robust and most securely protected web content ever imagined, and there is nothing else like it due to the ArtisBrowser, which unlike normal web browsers, is specially designed to protect web media from copy and theft... and now ArtisBrowser is available for all OS and devices!

About ArtistScope Site Protection Software (ASPS)

The ArtistScope Site Protection Software (ASPS) can be used on any type of web server and any type of website regardless of its program language or CMS type such as WordPress or Moodle. In fact for sites using the most popular CMS such as WordPress, Moodle, Drupal or Joomla, plugins are available to simplify the management of protected pages. With the ASPS Tag Management plugins, a site owner can simply nominate a URL or a keyword found in the URL of the pages to copy protect. Consequently only those pages that need protection will be protected, leaving the rest of the website accessible to normal browsers and search engines for SEO.

ASPS copy protection is so effective that anything displayed on a web page is most securely copy protected from absolutely all exploits. All media including images and video, even live streams can be copy protected, even though they may be served offsite from a media server or CDN.

Pricing and Availability

To install the ASPS server module for your web site, you will need a dedicated or virtual server for the rights to install at system level. All installations are performed by the ArtistScope team to ensure that the module suits the server OS and distribution, and that your web site/s. Installation and licensing is per server and multiple sites can be licensed at the time of purchase. For a one-time fee of \$495 your server and sites can be most securely protected within 24-48 hours of order confirmation.

About ArtistScope

ArtistScope has been the leading developer of "copy protection" since 1998 when they first invented it. Beginning with image protection for artists on the web, ArtistScope solutions have survived the ever changing Internet and evolved to provide the most secure copy protection solutions for all media, for which there is no comparison.

When most talk about DRM, they are simply referring to password protection. However passwords can be shared and when ArtistScope introduced DRM into their solutions to prevent sharing and unauthorized distribution, they revolutionized the meaning of DRM by using live call-to-home validation of subscriber access that not only locked user accounts to their computers, but it enabled total control for authors over all aspects, with immediate effect on any changes made, even to media already saved to a user's computer or still out in the wild on disk.
