

Identity and access management only as strong as the weakest link. But where is the weakest link?

Qubit Consulting joins forces with Oracle in December to shine the light on identity and access management

Sydney, 22nd November 2011: Australian IT company Qubit Consulting is shining the light on identity and access management system development at a joint seminar with Oracle in early December, in Sydney. At the centre of identity and access management (IAM) implementations is a dilemma: companies want to protect themselves and their customers' data, but they also want the maximum number of customers to have the widest possible access to services and products. At the same time, being able to specify IAM systems and implementations, and then extend their lifespans without compromising security, is essential to commercial success. The answer is to adopt an approach that makes change easy, maintains visibility and control, and can evolve quickly as security features and commercial functionality change. The joint Qubit Consulting-Oracle seminar will talk about how to resolve this dilemma, focusing on Oracle's new and emerging identity management stack, and Qubit Consulting's pragmatic approach to protecting organisations' IAM development investments. The seminar is being held at Sydney's Sheraton on the Park Hotel on Friday 9th December, starting at 8:30am. Register at Qubit's web site, www.qubitconsulting.com. Qubit Consulting has been in business for six years. Based on Sydney's Northern Beaches, its directors John Jones and Andrew Hayes, and many of its consultants, hail from Sun Microsystems. Qubit Consulting specializes in Identity and Access Management, Service Oriented Architecture, and Enterprise Java-based solutions. Over the past six years, Qubit Consulting has grown its operations on the back of engagements with Australian companies in the IT, financial services, commercial and telecommunications sectors.
